Conjugate of target seeking molety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is a modified Staphylococcus enterotoxin SEE superantigen. The wind-
type SEE superantigen is modified to be used in a novel conjugate. The
novel conjugate comprises a target seeking moiety and a modified wild
type superantigen. This modified superantigen retains its ability to
activate a subset of T cells, even though lor more wild-type amino acid
residues in at least 1 region which functions in determining binding to T
cell receptor (TCR) and activation of a subset of T cells has/have been
replaced. Such a modified superantigen can optionally be used as part of
a conjugate with a target seeking moiety, for activating the immune
system to treat a mammallan disease. A pharmaceutical composition can be
prepared comprising a modified antibody (preferably a Fab fragment fused
to a peptide moiety providing activation of T cells in Vbeta specific
manner) in which cysteines providing for interchain cysteine linkages in
                                                                                                                                                                                                                                                                                                                SBA; Staphylococcus enterotoxin; superantigen; conjugate; treatment; sr; infection; autoimmune disease; antibody; modified.

                                                                     à
                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the protein sequence of engineered staphylococcal superantigen SEA/E-18. The superantigen is based on staphylococcal enterotoxin E (SEE, see ABPS8456) except for 4 amino acid residues close to the N-terminal that were from enterotoxin A and one substitution in the C-terminal part, D227A. Models of new superantigen variants were nonstructed using the SEA/E-18 model as the template. These include the new engineered superantigen SEA/E-120 (see ABPS9455), which has been genetically fused to the Fab moiety of the tumour reactive antibody 5T4 color form a conjugate (see ABPS9455), polypeptide. The conjugate is a claimed example of novel conjugates of the invention comprising an engineered bacterial superantigen and an antibody moiety. The conjugates are designed to target and destroy cancer cells, including cancer of the prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface

the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and autoimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer side-effects when used as a drug, compared to wild type superantigen. Note: This sequence is not provided in the specification. It has been created by modifying the wild-type SEE superantigen sequence in Pages 38-39 of the specification
                                                                                                                                                                                                                                                                                                                                                      228

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU1255-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human
The present sequence is the protein sequence of staphylococcal enterotoxin SEB. The invention provides novel conjugates (see ABP58454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA.F120 (see ABP58456), which is based on SEE, and an antibody moiety, such as tumour reactive antibody 574. The superantigen is engineered to reduce seroreactivity whilet maintaining biological activity and production levels. The conjugates are designed target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 BEKKVPINLWIDGKQTTVPIDKVXTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ

immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 amil molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents a peptide sequence from Staphylococcus aureus enterotoxin type
                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                120

The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of AllMOTIS, confirmed to TAIN 844 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, actyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, and comprises a carboxyl group, and or group, hydrophobic group, and comprises a carboxyl group, and or printing the virus to the cell is inhibited. The peptides were cleantified by analysing the structure/motifs present in the HIV-1 glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat motif containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from or pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to a cell and Epstein-Barr virus infection. The present sequence is a protein from a pathogenic organism analysed for regions analogous to boil or DP178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This is the wild-type Staphylococcus enterotoxin SEE superantigen. This SEE superantigen can be modified to be used in a novel conjugate. The covel conjugate comprises a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of T cells, even though 1 or more wild-type amino acid residues in at least 1 region which functions in determining binding to T cells receptor (TCR) and activation of a subset of T cells has/have been cell receptor (TCR) and activation of a subset of T cells has/have been corpugate with a target seeking moiety, for activating the immune system to treat a mammadism disease. A pharmaceutical composition can be prepared comprising a modified antibody (preferably a Fab fragment fused to a peptide moiety providing activation of T cells in Vbeta specific composition and providing activation of T cells in Vbeta specific composition and the mative antibody have been replaced (preferably by serine residues) to probibit cysteine formation. The modified wild-type superantigen is used attorimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer confimunogenicity and reactivity with neutralising antibodies and has fewer conside-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                                                                               of target seeking moiety and modified superantigen - useful for
the immune system to treat cancer, viral infections, parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  228

WPI; 2003-361759/34. N-PSDB; ACA64698. A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

The invention relates to a mammalian cell receptor, useful in the creatment of cancer, which binds to tumour associated ligids and induces anergy or apoptosis in the T cells and antigan presenting cells (APCE). Also included are a mammalian cell useful in the treatment of cancer where the treatment of cancer where the treatment of cancer where the treatment of cancer where the binds tumours associated lipids and induces cellular inactivation or dash is deleted or functionally deactivated or producing (MJ) a tumourscideal limmanostyce population in vitus a mammallant cellular inactivation or dash is deleted or functionally deactivated or cellular inactivation or dash is deleted or functionally deactivated or cellular incorporated lipids and protectly collipids are inactivated or cellular cellular in the treatment of cancer comprising a lipid raft conjugated to a superantiged or functionally deactivated by tumours associated antigens is deleted or functionally deactivated in a composition useful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing (MS) a tumouricidal immunocyte population associated lipids are inactivated or eletered to produce a superantigen), producing (MS) a tumouricidal immunocyte population, and administering the tumouricidal lipid are inactivated or celleted to produce a superantigen), producing (MS) a tumouricidal limunocyte population, and administering the tumouricidal lipid are inactivated or celleted to population as vivo in a mammal lby allowing a tumouricidal lipid are inactivated or celleted to population as vivo in a mammal lby allowing a tumouricidal lipid are inactivated or celleted to functionally deactivated to produce a tumouricidal population of vivo in a mammal lby allowing a tumouricidal lipid and administering a tumouricidal population of contact membral or allowing a superantigen-lipid are tumouricidally activated or celleted or functionally deactivated to produce a tumouricidal population or vivo in a mammal or a mammal lby activat

Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SES) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit rumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence is the protein sequence of enterotoxin E (SEE) of Staphylococcus aureus. Similarity is shown, in several stretches of Staphylococcus enterotoxins, streptococcus pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB7623444). In the present invention, synthetic polypeptides useful in tumour therapy and in Dlocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal characterised by substantial structural homology to staphylococcal characterised by substantial structural homology and enterotoxin A and enterotoxin B, and to streptococcal pyrogenic characterised by substantial structural and enterotoxin B, and to streptococcal pyrogenic contexting, with statistically significant sequence homology and similarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and ctumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer contracting haematopoisetic cells from a patient with come or more superantigens ex vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the companies of the control of the control of the control of the control of the control of the control of the control of cells from a patient with the control of cells into the control of cells into the control of the control of cells into the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the contro

The superantigen is derived from staphylococcal senterocoxin E (SEB) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R20G, N21T, S24G, R27K, K79E, K81E, K83S and D227S. SEA/E-120 has been genetically fused to the Fab moitety of the tumour reactive antibody 574 to form a claimed conjugate (see ABPS8454) designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The present sequence is a conjugate of a bacterial superantigen and an antibody moiety, and has been designed to target and destroy cancer calls. The bacterial superantigen is SEA/F-120 (see also ABFSASS), which was derived from staphylococcal enterotoxin E (SEE) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst R2TK, K79E, K81E, K83S and D25TS. SEA/E-120 was genetically fused to the R2TK, K79E, K81E, K83S and D25TS. SEA/E-120 was genetically fused to the R5TM sequence to obtain higher yields: in the heavy chain, H41E, 844G, 169T and V113G, and in the light chain, P10S, T45K, 163S, F73L, T77S, L78V and L83A. An expression vector comprising DNA encoding the conjugate can be used to transform host calls for recombinant production of the conjugate: The conjugate is useful for treating cancer, including concerns and received the lump breast, colon, kidney, pancreas, ovary, stomach,
                                                                                                                                                                                                                                                 Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT

                                                                                                                                                                                                                                                                                                                                           SEE was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterocoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEE. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211

                                                                                                                                                      cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEA. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DP178-like; DP107-like; enterotoxin A; antifusogenic;
                                                                                                                                                                                                            The present sequence is the protein sequence of staphylococcal enterctoxin A (SEA). The invention provides novel conjugates (see ABP58454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABP58455), and an antibody moiety, such as tumour reactive antibody 5T4. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEKSEEINEKDIRKKSELQGTALGNIKQIYYYNEKAITENKESDDQFLENTLIFKGFFTG

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to main acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-I) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-ILAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS.

CO (10%10% Ast or PLZIF) sequence search motife, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group or macromolecular carrier group, and comprised and ogroup, hydrophobic group, or macromolecular carrier group, and fusion of the virus to the cell is inhibited. The peptides were confernitied by analysing the structure/fuorifs present in the HIV-1 cyloroprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat confidential in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues.

The method is useful for inhibiting transmission of Epstein-Barr virus to corganisms and HIV isolates, looking for DP107/178 sequence is a coll profor DP178. The regions analogues to protein from a pathogenic organism analyse of regions analogues to protein from a pathogenic organism analyse of regions analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             enterotoxin A; ent A; food poisoning; bacterium; food; milk; fruit juice;

superantigen. Nucleic acids encoding superantigens (see also AAW06737, AAW06739), esp. truncated forms of the superantigen lacking the leader peptide, can be used in the gene therapy of cancer, infectious diseases and immunological disorders. The nucleic acid, optionally in combination with cytokine or chemokine nucleic acids, is delivered to an animal using such as T-cells, macrophages, monocytes and/or natural killer cells, localised produ. Of an effective but non-toxic amount of encoded proteins allows safe treatment of the animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62 SWYNDLLVDFDSKDIVDKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTE 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Db
                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel oligonucleotide primers directed against enterotoxin A gene (ent A) of Staphylococcus aureus and heat stable enterotoxin A gene (ptt A) of bacterial aversinia enterocolitica. The novel oligonucleotide primers are useful for simultaneously detecting food oligonucleotide primers are useful for simultaneously detecting food poisoning bacterial species Staphylococcus aureus and/or Yersinia enterocolitica in food systems e.g., milk fruit juices and ice creams, without prior enrichment for detecting the bacteria strains in quantity as low as one cell. The method can be directly used for detecting bacterial strains. The oligonucleotide primers allow quick and highly sensitive detection of the food poisoning bacterial species. This sequence represents the protein derived from the enterotoxin A gene from Staphylococcus aureus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This is the wild-type Staphylococcus enterotoxin SEA superantigen. This SEA superantigen can be modified to be used in a novel conjugate. The novel conjugate comprises a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of T cells, even though l or more wild-type amino acid activate as used of T cells, even though l or more wild-type amino acid cell receptor (TCR) and activation of a subset of T cells has/have been coll receptor (TCR) and activation of a subset of T cells has/have been replaced. Such a modified superantigen can optionally be used as part of a conjugate with a target seeking moiety, for activating the immune system to treat a mammalian disease. A pharmaceutical composition can be prepared comprising a modified antibody for activating the immune to prepared comprising a modified antibody of T cells in Vbeta specific consumers) in which cysteines providing activation of T cells in Vbeta specific consumers. In the cysteine formation. The modified wild-type superantigen is used the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used autocimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer consumers.
                                                                                                                                                                                                                                                                                                    Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                               Claim 8; Page 36-37; 58pp; English

Staphylococcus aureus enterotoxin A protein. Tumour; cancer; immune; enterotoxin AAB67338 standard; peptide; 233 23-APR-2001 AAB67338; RESULT 21 AAB67338 

The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo ö 120 120 180 60 9 cell capable of stimulating antitumor immune reactivity in vitro o EEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 1 SEKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAITENKESDDQFLENTLLFKGFFTG HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 61 HSWYNDLLVDFDSKDIVDKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT Gaps RGLIVFHSSEGSTVSYDLFDAQGQYPDTLLRIYRDNKTINSENLHIALYLYTT 233 . 0 Length 233; 24; Indels 83.2%; Score 1030; DB 4; 82.8%; Pred. ```
Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SES) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a mammalian cell receptor, useful in the creatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptors which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumousoppressive fatty acids, ceramides, glycosphiads, producing (MI) a tumousoppressive fatty acids, ceramides, glycosphiads, phingolipids, glycosphiagolipids, phosphosphingolipids, glycosphiads, producing and protecely/colipids are inactivated or cleteds), a construct useful in the treatment of cancer (where an adaptor protein which inhibits T cell activation by tumour associated antigens is deleted or superantigen (SAG) nuclectide inserted into a virus a mammalian T cell activation by tumour associated antigens is deleted or inhibits T cell activation by tumour associated antigens is deleted or concert (comprisant) a lipid raft conjugated to a superantigen), producing (MI) a tumour associated lipids are immunocytee, in which receptors for the lipids are inmunocytee, in which allowing tumour associated lipids are immunocytee, in which receptors for the lost), producing (MI) a tumouricidal immunocyte population, and administering the tumouricidal appropriation and administering the tumouricidal appropriation and administering APC or the host), producing (MI) a tumouricidal which adaptor proteins witch inhibit T cell and and administering a lipid and anomal administering the tumouricidal population of cells to the host), treating daministering the tumouricidally activated T cells in which adaptor proteins witch inhibit T cell activated or deleted or produce a tumouricidal population of the lost of administering the tumouricidally activated or deleted or produce a tumouricidal and antigen to contact immunocytees or the host). producing a superantigen-lipid raft conjugate to contact i A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells. Disclosure, Page, 167pp, English

fusion constructs with anti-tumour proteins or motifs. The, present sequence represents a bacterial superantigen protein (e.g. a staphylococcal enterotoxin). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=20020177551"

present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal exotoxins, with statistically significant sequence homology and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with one or more superantigens as vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The present sequence is the protein sequence of staphylococcal enterotoxin A (SBA) vaccine, periplasmic (A489270P). The vaccine comprises 3 amino acid substitutions introduced into the SBA sequence: L48R, Y89A and D70R. These mutations reduce the binding of the toxin to major histocompatibility complex (MHC) Class II and/or T cell receptors. The full-length expressed product is secreted into the periplasmic space of Escherichia coll host cells, and the leader peptide is recognised and cleaved by a native mechanism. The vaccine is used to protect against superantigen toxin infections. Superantigen attributes are absent, but the superantigen toxin infections. Superantigen attributes are absent, but the superantigen toxin infections produced. In examples from the appropriate antibody response is produced. In examples from the invention, attendated superantigen toxins were shown to protect animals invention, attendated superantigen toxins were shown to protect animals the altered superantigen toxin. Methods of producing and using the range toxins from SEA, SEB, SEC-1, TSST-1 and streptococcal SPEa is predicted to provide protective immunity against the majority of bacterial superantigen toxins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or I cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing Infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the spectral effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or I cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin
                                                                                                                                                                                                                                                                       New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the WHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered cell transformed with the recombinant DNA construct, producing altered superantigen toxin peptide, diagnosing superantigen-associated bacterial superantigen toxin peptide, diagnosing superantigen-associated bacterial or producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an artisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 SDED). The superantigen toxin by fragment is useful for preparing a composition for treating or preventing bacterial infection. The present setting an entire of preventing a composition or the present setting an entire of preventing and enterpressents the LassIL48RADTORYSBGYTYSDA (with reference to the mature and processed to the mature and New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection. by Glu" 'note= "Wild-type Asp substitued by Arg" /note= "Wild-type Tyr substitued by Ala" note= "Wild-type Leu substitued by Arg" mature protein sequence) mutant of periplasmic SEA note= "Wild-type Leu substitued /note= "Wild-type Tyr substitued 5. .257 |Tabel= Mature\_SEA\_mutant #1 . .24 |Tabel= Signal\_peptide Disclosure; Page 22-23; 68pp; English. 120 144 180 EEKKVPINLWLDGKQNIVPLETVKINKKNVIVQELDLQARRYLQEKYNLYNSDVPDGKVQ 204 The invention provides a superantigen toxin DNA fragment which has been genetically altered such that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is disrupted or altered. DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the 9 84 New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection. 25 SEKSEEINEKDLRKKKSELÇGTALGNLKQIYYYNEKAKTENKESHDQFRQHTILFKGFFTD 85 HSWYNDLLVRFDSKDIVDKYKGKKVDLYGAYAGYQCAGGTPNKTACMYGGVTLHDNNRLT EEKKVPINIMIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 1 SEKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAITENKESDDQFLENTLLFKGFFTG 61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT Gaps 181 RGLIVFHSSEGSTVSYDLFDAQGQYPDTLLRIYRDNKTINSENLHIALYLYTT 233 205 RGLIVEHISTEPSVNYDLFGAQGQYSNTLLRIYRDNKTINSENMHIDIYLYTS 257 RGLIVFHSSEGSTVSYDLFDAQGQYPDTLLRIYRDNKTINSENLHIALYLYTT 233 . The present sequence is represents a mutant Staphylococcal enterotoxin A.

It is encoded by a mutant SEA gene. The mutant gene product is unable to bind to the MHC on T-cells, and so is non-toxic. Mutant SEA and SEB genes were inserted into a Venezuelan equine encephalitis (VEE) replicon control of the MHC on T-cells, and so is non-toxic. Self-replicating RNA derived from the recombinant VEB vectors can be used as a nucleic acid vaccine, or to transfect cells along with RNA from helper plasmids. The recombinant proteins produced are used as vaccines for providing immunity against Staphylococcal intoxication or as a disapnossic tool for detection of Staphylococcus exotoxin. The transformed host cells are used to analyse the effectiveness of drugs and agents which inhibit S. aureus comprising the mutant SEA or SEB genes are used for providing immunity against Staphylococcal exotoxins. Infectious alpha-virus particles comprising the mutant SEA or SEB genes are used for providing immunity against Staphylococcal exotoxins by generating a protective immune reaction in humans or animals. The vaccines are used to reduce disease symptoms or reduce severity of disease caused by enterotoxins of S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New DNA construct useful as vaccines against enterotoxins of
Staphylococcus aureus which causes gastrointestinal distress, or toxic

The present sequence is the protein sequence of staphylococcal enterotoxin A (SEA) vaccine, cytoplasmic (A489270C). The vaccine comprises 3 amino acid substitutions introduced into the SEA sequence: L48R, Y89A and D70R. These mutations reduce the binding of the toxin to major histocompatibility complex. (MHC) Class II and/or T cell receptors. The protein is expressed as a nonsecreted product within host Escherichia coll: The vaccine is used to protect against superantigen toxin infections. Superantigen attributes are absent, but the superantigen is effectively recognised by the immune system and an appropriate antibody response is produced. In examples from the invention, attenuated superantigen toxins were shown to protect animals against challenge with

encoded to the binding of the encoded to the comparation of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating barticularly useful for producing vaccine against superantigen are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin A #2

wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and therapy, are provided. A multivalent vaccine consisting of altered superantigen toxins from SEA, SEB, SEC-1, TSST-1 and streptococcal SPEa is predicted to provide protective immunity against the majority of bacterial superantigen toxins
                                                                                                                                                                                                                                                                                                                                                                             121

Also disclosed are mutated staphylococcal enterotoxin A, B, Cl (SEA, SEB, SEC1) and streptococcal pyrogenic enterotoxin a and b (spea and SPBb). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the L42E/L48R/D70R/Y89G/Y92A mutant of cytoplasmic
                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered 15ST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61

```
The invention provides a superantigen toxin DNA fragment which has been genetically altered such that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is disrupted or altered. DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQR

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MRC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating cuperantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus content and succeived by the indexer from the wild-type staphylococcus enterotoxin A sequence (see ACAGII78)
                                                                                                                                                                                                                                                                                                                                                                                                           New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        . 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MFC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating cuperantigen associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the infectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus enterotoxin A K14E mutant. Note: The present sequence is not present in the specification but was created by the indexer from the wild-type staphylococcus enterotoxin A sequence (see ACAGI178)

The coding region of the SAG toxin when allored by site directed mutagenesis, results in disruption of binding of the toxin to both the MHC class II or T-cell antigen receptor. SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific antibodies. This vaccine overcomes the disadvantages of the chemically inactivated toxoids and is staphylococcal and streptococcal toxins. It is used for the diagnosis and treatment or amelioration of superantigen- associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present amino acid sequence is the mutant Staphylococcal enterotoxin. A (SEA), a bacterial superantigen toxin (SAg), used for the formulation of SEA vaccine A489270P. The coding region of this SAg toxin is altered by site directed mutagenesis, that results in disruption of binding of the toxin to both the MHC class II or T-cell antigen receptor. This altered SAg toxin has the leader peptide cleaved by native bacterial encymatic mechanism and the first residue of the mature protein is encoded by the transcriptional start site (ATG). SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific antibodies. This vaccine overcomes the

                                                                                                                                                                                                                 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in \Gamma cells and antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal
